

Miva Script Compiler 1.09
Release Note
Revision 1.0

Bugs Fixed:

1. Tags that start with "mv", but are not recognized as currently supported Miva Script tags will now give a compiler warning.
2. Expressions that would leave more or less than one operand on the stack will now give compiler errors. This will eliminate "stack underflow" errors at runtime with certain statements, as well as prevent text operators ("CRYPT", "POW", etc.) that are misspelled from being interpreted as unscoped variables.
3. The POW operator will now compile correctly.
